10 / N/C

SHORT DATEX REPAIR

when reusing original cable with Viamed clip

Soldering iron set to 250 degrees, to prevent heat damage to components.

1/ Determine fault - check for poor pad alignment, intermittent or non-existent component connection, physical damage to clip, physical damage to cable, physical damage to connector, and intermittent circuitry at points of strain, such as the clip end strain relief and the connector end strain relief. If there is no damage to the cable or connector, they can be reused. Any parts to be reused should be cleaned thoroughly with isopropyl alcohol or foam cleaner.

2/ Remove pads from shells.

3/ Remove components from pad housing.

4/ Clean excess silicone from components, ensuring that the contacts are as clean as possible.

5/ Desolder old wiring from components.

6/ Reposition components into the new pads, removing any obstacle rubber to allow comfortable fitting of components - note that replacement pads must be the same colour as the original pads, so that components from a white pad must go into a white pad, and component s from a black pad must go into a black pad.

7/ Place a small amount of flowable non-corrosive silicone sealant onto the face of the components and place into pads, ensuring that both emitter and detector are central in pad windows. Note that the silicone on the outside of the pad must run to the contour of the pad to make a smooth window - there should be no doming or sinking of the window. Any excess can be removed with a small screwdriver, also any deficit can be topped up with small amounts of silicone from a screwdriver tip - however these steps should be taken within 2 minutes of the component being placed in the pad, before the silicone has had time to become tacky, so that it is still flowing enough to ensure that the window will return to a smooth flat surface. Leave pads to set for 24 hours

8/ Prepare new cable as follows:

a/ Attach strain relief "0010150," to cable, and glue in position.

b/ Strip back outer cable cover of exposed end flush to strain relief.

c/ Cut back interwoven shield.

d/ Strip and tin red and black wires to required lengths - approximately 2.5 cm from end of cable cover.

SHORT DATEX REPAIR

when reusing original cable with Viamed clip

e/ Cut inner white cable to 8.5 cm from end of outer cable cover, strip last centimetre of inner cable cover, strip and tin end of exposed green wire.

f/ Twist copper coloured shield around itself and tin end.

9/ Resolder wires to components as per relevant diagram.

10/ Reassemble the clip as follows:

a/.Glue white inner cable into channel in detector pad

b/ Fill around component with silicone.

c/ Glue pad support onto back of detector pad.

d/ Glue pad support on to back of emitter pad.

e/ Glue white inner cable into channel in emitter pad.

f/ Fill around component with silicone.

g/ Refit replacement springs “0010140,” around pads.

h/ Push pads into position within clip, making sure that the pad support rim is securely underneath the pad retaining lugs - there are four retaining lugs for each pad. If any lugs are not holding the pad support securely, then add a drop of superglue to the relevant lug.

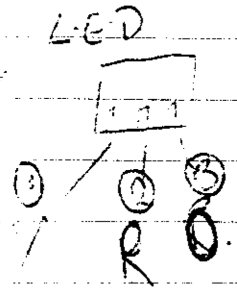
i/ Glue strain relief into position in clip body.

10/ Attach labels to probe as required.

/ Strain relief 7.5-8cm down.

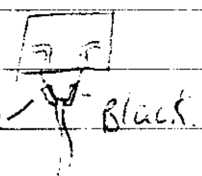
5/ Strip wire + leave shield at about 1cm. tin end.

Blue 2.5cm, tin end. red orange and yellow same as p377's. Tin ends.



1/ Yellow
2/ RED
3/ ORANGE

/ put sensors on white left. Black right



solder 20k r to blue + shield. heatshrink.
