

6. Product designing description

6.1 Neonatal phototherapy eye mask

6.1.1 Intended use

Neonatal phototherapy eye mask is used to protect baby's eyes during phototherapy treatment.

6.1.2 Product description

Neonatal phototherapy eye mask can block blue light and other various strong visible light. It can protect baby's eyes well by blocking the blue light during the phototherapy treatment.

It is soft, water-absorbent, permeable, safe, without stimulation, not easy to shed-off.

It mainly consists of mask body, shield pad and adhesive tape.

The mask body is used to fix the eye mask on the head of the neonatal baby, and make sure the shield pad is placed on the eyes of the baby. It is divided as Large, medium, small and extra small according to the size.

The mask body is made by elastic bandage or elastic nonwoven cloth, which is soft, comfortable, with good permeability and elasticity.

The material can be ranked as follows:

Spunlaced nonwoven cloth, medical elastic bandage, adhesive tape, heat-sealed by ultrasonic

Elastic bonding spunlaced nonwoven cloth, adhesive tape, heat-sealed by ultrasonic.

Elastic bonding nonwoven cloth, adhesive tape, heat-sealed by ultrasonic.

Spunlaced nonwoven cloth, medical infusion stick, heat-sealed by ultrasonic.

The shield pad is used to block the blue light during phototherapy treatment, which is made of blue&black physical bonding fabric. It is ranked as large, medium, small, extra small according to the size. It is pasted on the mask body or built-in fixedly.

The adhesive is on the two sides of the mask body to offer the fixing function. It is heat-sealed on the mask body by ultrasonic.
