### **EMC TESTS & RESULTS**

This instrument is designed to be normally switched off. It can only be used for a few seconds after the function switch is pressed.

It will not be affected by extraneous interference.

It is designed to deliver high current pulses into the patient to enable the ulnar nerves to twitch.

The only reported problem since 1986 has been one suspected case of interference to a pacemaker.

No “EMC” Test Results are available for this product.
