Conforms to AAMI STD ES60601-1, ISO STD 80601-2-55, IEC STDS 60601-1-6, 60601-1-8 & 62366 Certified to CSA STD C22.2 No. 60601-1

This manual describes the function, operation and maintenance of the Maxtec Model MAXO₂ME oxygen monitor. The MaxO₂ME utilizes the Maxtec MAX-550E oxygen sensor and is engineered for fast response, maximum reliability and stable performance. The MaxO₂ME is designed primarily for continuous monitoring of oxygen levels delivered by medical oxygen delivery equipment and respiratory care systems. Adjustable high and low level alarm set points make the MaxO₂ME ideal for use in neonatal, anesthesia and respiratory care.

: CLASSIFICATION

Protection Class:	II, Type B
Ingress Protection Rating:	IPX2
Mode of Operation:	
Sterilization:	See section 6.0
Safety of application in the presence of a flammab	le anesthetic mixture: See section 8.1
Power specification:	7.5V(MAX) === 1.9W.250mA(MAX)

CAUTION: Federal law restricts this device to sale by or on the order of a medical professional.

Product Disposal Instructions:

The sensor, batteries, and circuit board are not suitable for regular trash disposal. Return sensor to Maxtec for proper disposal or dispose according to local guidelines. Follow local guidelines for disposal of other components.

WARRANTY

The MaxO₂ME Monitor is designed for medical oxygen delivery equipment and systems. Under normal operating conditions, Maxtec warrants the MaxO₂ME Monitor to be free from defects of workmanship or materials for a period of two (2) years from the date of receipt from Maxtec, provided that the unit is properly operated and maintained in accordance with Maxtec's operating instructions. Based on Maxtec's product evaluation, Maxtec's sole obligation under the foregoing warranty is limited to making replacements, repairs, or issuing credit for equipment found to be defective. This warranty extends only to the buyer purchasing the equipment directly from Maxtec or through Maxtec's designated distributors and agents as new equipment. Maxtec warrants the MAX-550E oxygen sensor in the MaxO₂ME Monitor to be free from defects in material and workmanship for a period of two (2) years from Maxtec's date of shipment in a MaxO₂ME unit. Should a sensor fail prematurely, the replacement sensor is warranted for the remainder of the original sensor warranty period. Routine maintenance items, such as batteries, are excluded from warranty. Maxtec and any other subsidiaries shall not be liable to the purchaser or other persons for incidental or consequential damages or equipment that has been subject to abuse, misuse, mis-application, alteration, negligence or accident. These warranties are exclusive and in Lieu of all other warranties. Expressed OR IMPLIED, INCLUDING WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NOTE: In order to obtain optimum performance from your MaxO₂ME monitor, all operation and maintenance must be performed in accordance with this manual. Please read the manual thoroughly before using the monitor and do not attempt any repair or procedure that is not described herein. Maxtec cannot warrant any damage resulting from misuse, unauthorized repair or improper maintenance of the instrument.

∵ WARNINGS

FAILURE TO COMPLY WITH THESE WARNINGS AND CAUTIONS COULD RESULT IN INSTRUMENT DAMAGE AND POSSIBLY JEOPARDIZE THE WELL BEING OF THE PATIENT AND/OR HEALTH CARE PROFESSIONAL.

- » Before use, all individuals who will be using the MaxO₂ME must become thoroughly familiar with the information contained in this Operation Manual. Strict adherence to the operating instructions is necessary for safe effective product performance. This product will perform only as designed if installed and operated in accordance with the manufacturer's operating instructions.
- » This product is not intended as a life-sustaining or life-supporting device.
- » Medical Oxygen should meet the requirements of USP.
- » The Alarm limits can be set to levels that would render them useless for a particular patient's clinical condition. Ensure that the delivered oxygen level and flow rate are set to values prescribed by the patient's physician. Also ensure that the high and low alarm limits are set to levels such that they will sound if the oxygen level is outside of safe limits. Be sure to review and, if necessary, reset the alarm limits when the patient's clinical condition changes or when the patient's physician prescribes a change in oxygen therapy.
- » To avoid explosion, SDO NOT operate the oxygen monitor in the presence of flammable anesthetics or in an atmosphere of explosive gases. Operating the oxygen monitor in flammable or explosive atmospheres may result in fire or explosion.
- » Never allow an excess length of cable near the patient's head or neck, as such could result in strangulation. Secure excess cable to the bed rail or suitable object.
- » Never use a MaxO₂ME monitor with a cable that appears worn, cracked or has damaged insulation.
- » The oxygen sensors contain a weak acidic solution encapsulated in a plastic housing. Under normal operating conditions the solution (electrolyte) is never exposed. In case of a leak or if damaged, **DO NOT** use the oxygen sensor.
- » Use only genuine Maxtec accessories and replacement parts. Failure to do so may seriously impair the monitor's performance. Repair or alteration of the MaxO₂ME beyond the scope of the maintenance instructions or by anyone other than an authorized Maxtec service person could cause the product to fail to perform as designed. No modification of this equipment allowed.
- » Calibrate the MaxO₂ME weekly when in operation and if environmental conditions change significantly. (I.e., Temperature, Humidity, Barometric Pressure. Refer to Calibration section of this manual).
- » Use of the MaxO₂ME near devices that generate electrical fields may cause erratic readings.
- » If the MaxO₂ME is ever exposed to liquids (from spills or immersion) or to any other physical abuse, turn the instrument OFF, remove batteries and allow to dry completely, then power ON. This will allow the unit to go through its self test and make sure everything is operating correctly.
- » Never autoclave, immerse in liquid or expose the MaxO₂ME (including sensor) to high temperatures (>50°C). Never expose the device to liquid, pressure, irradiation vacuum, steam, or chemicals.
- » To protect the unit from potential leaky battery damage always remove batteries when the unit is going to be stored (not in use for 30 days or more) and replace dead batteries with recognized name brand AA Alkaline batteries.
- **ODO NOT** use rechargeable batteries.
- » This device does not contain automatic barometric pressure compensation.
- » Not for use in an MRI environment.
- » Battery replacement by inadequately trained personnel could result in a safety hazard.
- » Electrical shock or damage to the equipment may occur if an inappropriate external power supply is used. Maxtec recommends using only the Maxtec approved external power supply, as listed in 9.0 Spare Parts and Accessories.

NOTE: The $MaxO_2ME$ oxygen monitor has been manufactured with a low alarm setting adjustable down to 15% that requires deliberate action to set it below 18%. See section 3.1 Alarm Setting Procedure.

- **⋄DO NOT** clean or dry the MaxO₂ME with a high pressure air gun. Applying high pressure air to the MaxO₂ME may damage components and render the system inoperable.
- ♦ DO NOT over clean the MaxO₂ME. Repeated use of a cleaning agent can cause residue buildup on critical components. Excessive residue buildup can affect the MaxO₂ME's performance.
- » When cleaning the MaxO₂ME: OD NOT use harsh abrasives. OD NOT immerse the MaxO₂ME in liquid sterilizing agents or liquids of any kind. OD NOT spray cleaning solution directly onto the device. OD NOT allow cleaning solution to pool on the device.
- **DO NOT** sterilize the MaxO₂ME. Standard sterilization techniques may damage the monitor.
- » If the MaxO₂ME does not function as outlined in section 2.0, contact a Maxtec trained service technician or Maxtec for service.
- ♦ DO NOT allow the sensor to come in contact with exhaled patient gases or other potential sources of contamination. The sensor face cannot be decontaminated if it comes in contact with infectious agents.
- » Gas leaks that cause room air to mix with the gas sample may cause inaccurate oxygen readings. Ensure the O-rings on the sensor and flow diverter are in place and intact prior to use.
- ◇ DO NOT expose the sensor face to liquids or allow humidity to condense on the face of the sensor as this may impair the function of the MaxO₂ME.
- » The MaxO2 ME and sensor are non-sterile devices.
- » Regularly inspect the MaxO₂ME and associated components for damage or electrolyte leakage prior to use.
- **DO NOT** use if damaged.
- **DO NOT** obstruct alarm.
- **DO NOT** smoke in an area where oxygen is being administered.
- » The MaxO₂ME may only be calibrated using 20.9% oxygen (room air) or 100% oxygen. Calibration at other concentrations will result in inaccurate readings.
- » The MaxO₂ME may be used for ground transport but should not be used during air transport as changes in barometric pressure will alter the monitor readings.
- » The oxygen sensor should be operated in an upright position (sensor face downwards). Operating the oxygen sensor upside down may cause the sensor to function improperly.
- » When using the approved external power supply, functional batteries must also be installed in the device. The device will not operate solely on the external power supply.

BUTTON & SCREEN SYMBOL GUIDE

The following symbols are found on the MaxO₂ME:

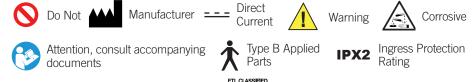

SYMBOL GUIDE

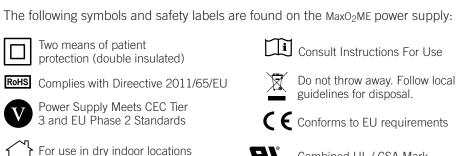

The following symbols and safety labels are found on the MaxO₂ME and/or labeling:

∴ 1.0 SYSTEM OVERVIEW

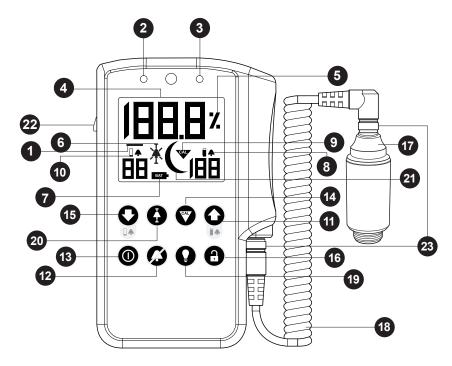

1.1 Base Unit Description

The MaxO₂ME is a handheld oxygen analyzer/monitor capable of measuring the oxygen concentration from 0% to 100% in a sample gas. A MAX-550E oxygen sensor outputs a voltage which is used by the MaxO₂ME to determine the concentration of oxygen based on a calibration at room air or 100% oxygen. The MaxO₂ME contains alarms that can be controlled by the user to set a maximum or minimum allowable oxygen concentration.

- » Oxygen sensor of approximately 1,500,000 O₂ percent hours.
- » External probe with 10 ft., extendable cable and diverter fitting for standard 15 mm "T" adapter.
- » Operation using 4 AA alkaline batteries (4 x 1.5 volts) for approximately 5000 hours of performance with typical use.
- » Oxygen-specific, galvanic sensor that achieves 90% of final value in approximately 15 seconds at room temperature.
- » Self-diagnostic check of analog and microprocessor circuitry.
- » Low battery indication.
- » Calibration reminder timer that alerts the operator, using a calibration icon on the LCD display, to perform a unit calibration.
- » Adjustable high-level and low-level alarming capability with flashing LED and audible indication of alarm conditions.
- » Smart high-low alarm setting to help adjust alarm settings quickly
- » Back-light display with auto ambient light level detection.
- » Sleep Mode operation to extend battery life.

Indication for Use:

The MaxO₂ME oxygen monitor is intended for continuous monitoring of the concentration of oxygen being delivered to patients ranging from newborns to adults. It can be used in the pre-hospital, hospital and sub-acute settings. The MaxO₂ME is not a life supporting device.

1.2 Component Identification

- 1 <18% Alarm Indicator The <18% alarm indicator is located above the Low Alarm Indicator digits. When the low alarm setting is set below <18%, the indicator will flash each second to alert the operator of this special condition. See section 3.1.1 for setting this low alarm condition.
- 2 Low Alarm LED In a low alarm condition, the yellow "LOW ALARM" LED will flash once every two seconds, accompanied by the audio buzzer. If the Oxygen level is below 18%, the red "LOW ALARM" LED will flash twice per second accompanied by the audio buzzer.
- 3 High Alarm LED In a high alarm condition, the yellow "HIGH ALARM" LED will flash once every two seconds accompanied by the audio buzzer.
- 4)3 1/2-Digit Display The 3 1/2 digit liquid crystal display (LCD) provides direct readout of oxygen concentrations. The digits also display error codes, alarm set modes and calibration codes as necessary.
- **5** % **Symbol** The "%" sign is located to the right of the concentration number and is present during normal operation.
- 6 Alarm Silence/Smart Alarm Indicator When the silent key is pressed the indicator will display with cross bars ★ to alert condition. When Smart Alarm Mode Button is pressed the indicator will display with T-bars ♣ to alert condition.
- **7** Low Battery Indicator BAT The low battery indicator is located at the middle of the display and is only activated when the voltage on the batteries is below a normal operating level.

- 8 High Alarm Indicator The high alarm setting is displayed at all times just below the "HIGH" icon on the LCD readout. The indicated value represents the oxygen percentage at which the high alarm will be activated.
- **9** Calibration Reminder The calibration reminder symbol is located at the bottom of the display. This symbol will be lighted after one week has elapsed from the previous calibration.
- **10** Low Alarm Indicator ☐ ♠ The low alarm setting is displayed at all times just below the "LOW" icon on the LCD readout. The indicated value represents the oxygen percentage at which the low alarm will be activated.
- 11) Up (Alarm High) The up key is used in setting the high FiO₂ alarm limit. The device must be in the unlocked state for the key to operate. See section 3.1.2 for instructions on setting the high FiO₂ alarm limit.
- (12) Alarm Silence Indicator (5) In an alarm condition, pressing the SILENT key will deactivate the audio alarm for 2 minutes.
- (13) ON/OFF Key (13) This key is used to turn the device on or off. To turn the device OFF, the button must be held while a rapid 3-2-1 countdown takes place to prevent accidental power-off.
- (14) Calibration Key This key is used to calibrate the device. The device must be in the un-locked state for the key to operate. See section 2.2.2 for instructions on calibrating.
- **Down (Alarm Low)** The down key is used in setting the low FiO₂ alarm limit. The device must be in the unlocked state for the key to operate. See section 3.1.1 for instructions on setting the low FiO₂ alarm limit.
- (16) Un-lock Key (16) The un-lock key is used to unlock and lock the instrument.
- (17) Sensor with Diverter The sensor (with diverter) is designed to fit industry standard, 15mm I.D. "T" adapters.
- (18) Coiled Cable The coiled cable allows the sensor to be positioned up to 8 feet from the side of the unit.
- (19) Backlight ① The backlight key will manually activate the backlight for 30 seconds. See section 3.4 for more information on backlighting operation.
- 20) Smart Alarm The smart alarm key is used to help set the High-Low Alarm window quickly. See section 3.1.3 for instructions on using the smart alarm setting.
- 21) Sleep Mode Indicator The sleep mode Indicator is used to help with battery consumption. See section 3.5 Sleep Mode Operation.
- **External Supply Port** The port provides connection for the external power supply. See section 3.6 for more information on the power adapter.
- (23) Locking Shroud Threaded coupler that locks cable to sensor and monitor.

1.3 MAX-550E Oxygen Sensor

The MAX-550E is a galvanic, partial pressure sensor that is specific to oxygen. It consists of two electrodes (a cathode and an anode), a FEP membrane and an electrolyte. Oxygen diffuses through the FEP membrane and immediately reacts electrochemically at a gold cathode. Concurrently, oxidation occurs electrochemically at a lead anode, generating an electrical current and providing a voltage output. Electrodes are immersed in a unique gelled weak acid electrolyte which is responsible for the sensors long life and motion insensitive characteristic. Since the sensor is specific to oxygen, the current generated is proportional to the amount of oxygen present in the sample gas. When no oxygen is present, there is no electrochemical reaction and therefore, negligible current is produced. In this sense, the sensor is self-zeroing.

CAUTION: The MAX-550E oxygen sensor is a sealed device containing a mild acid electrolyte, lead (Pb), and lead acetate. Lead and lead acetate are hazardous waste constituents and should be disposed of properly, or returned to Maxtec for proper disposal or recovery.

CAUTION: Dropping or severely jarring the sensor after calibration may shift the calibration point enough to require recalibration.

CAUTION: The flow diverter for the sensor is for use with flowing gases only.

◆ DO NOT use the diverter when performing static sampling, such as in incubators, oxygen tents, oxygen hoods, etc.

∴ 2.0 SET-UP PROCEDURE

2.1 Battery Installation

All $MaxO_2ME$ units are powered by four, AA, alkaline batteries (4 x 1.5 Volts) and are shipped without the batteries installed. The battery compartment is accessible from the back side of the unit. Batteries should be changed by qualified service personnel. Use only brand name batteries. Replace with four AA batteries and insert per orientation marked on the device.

To install the batteries:

- 1. Release the thumb screw by turning it counter-clockwise until it pops out.
- 2. Install the four, AA, alkaline batteries (4 x 1.5 Volts) in the unit, observing the orientation shown on the plastic inside the compartment.
- 3. Slide the battery compartment cover back onto the case. Press in on the thumb screw while turning it clockwise until it engages the thread in the enclosure. Turn until it is lightly tightened. Do not over-tighten.
- ▲ WARNING: Battery replacement by inadequately trained personnel could result in a safety hazard. The MaxO₂ME will automatically perform a new calibration any time the batteries are removed or replaced. Ensure that the sensor is exposed to either 20.9% oxygen (room air) or 100% oxygen when changing the batteries to avoid mis-calibration.
- ▲ WARNING: Electrical shock or damage to the equipment may occur if an inappropriate external power supply is used. Maxtec recommends using only the Maxtec approved external power supply as listed in 9.0 Spare Parts and Accessories.

When batteries are installed in the $MaxO_2ME$, the unit initiates a self diagnostic test. All segments of the LCD readout are turned on for approximately 2 seconds. The audio buzzer sounds and the high and low alarm LEDs are illuminated. When the diagnostic test is completed successfully, the word "CAL" will display and then automatically initiate a calibration.

2.2 Calibrating the MAXO₂ME Monitor

2.2.1 Before You Begin

A protective film covering the threaded sensor face must be removed; wait approximately 20 minutes for the sensor to reach equilibrium.

Next, the MaxO₂ME Oxygen Monitor should be calibrated. Thereafter, Maxtec recommends calibration on a weekly basis. However, more frequent calibration will not adversely affect product performance.

Calibration of the instrument should be performed when the temperature of the gas stream changes by more than 3 degrees Celsius.

Changes in barometric pressure can affect the oxygen reading. A 1% change in the barometric pressure results in an error of 1% of actual reading (Example: If you are reading a 50% oxygen mix and the barometric pressure drops from 1000mbar to 990mbar the reading will drop to: 50% x (990/1000) = 49.5%). Maxtec recommends that you re-calibrate after changing point-of-use elevation by more than 500 feet (150m).

In addition, calibration is recommended if the user is unsure when the last calibration procedure was performed or if the measurement value displayed is in question. It is best to calibrate the $MaxO_2ME$ Monitor at a pressure and flow similar to your clinical application.

NOTE: Before beginning calibration the MAX-550E sensor must be in thermal equilibrium. You may also need to be aware of other factors which affect device calibration values. For more information, refer to "Factors Influencing Calibration and Performance" in this manual. The main display is capable of reading oxygen in the range of 0-105%. This additional range beyond physically possible concentration is to allow the user to be able to see if the device is reading accurately by testing in room air or 100% oxygen.

2.3 Set Operating Mode

2.3.2 To Calibrate the MaxO₂ME Monitor to 20.9% Oxygen

- 1. Ensure the sensor is in room air and has had sufficient time to equilibrate with room temperature.
- 2. Using the ON/OFF key **()**, make sure the unit is powered on.
- 3. Allow the oxygen reading to stabilize. This will normally take about 30 seconds or more.
- 4. Press the Un-lock key 1 to unlock the keypad. Note the LOW, Smart Alarm, CAL, and HIGH icons will begin to flash indicating the SET OPERATING MODE.

- 5. Press the CALIBRATION key on the keypad. The word "CAL" will appear on the display for approximately 5 seconds and then finish with 20.9%.
- 6. The unit is now calibrated and in the normal operating mode.

2.3.3 To Calibrate the MaxO₂ME Monitor to 100% Oxygen (recommended)

- 1. Place the external probe in a stream of medical grade USP or greater than 99% purity oxygen. Expose the sensor to the calibration gas at a regulated pressure and flow at a rate of 1-10 liters per minute (2 liters per minute is recommended).
- 2. Using the ON/OFF key **()**, make sure the unit is in the normal operating mode.
- 3. Allow the oxygen reading to stabilize. This will normally take about 30 seconds or more.
- 4. Press the Un-lock key 1 to unlock the keypad. Note the LOW, Smart Alarm, CAL and HIGH icons will begin to flash indicating the SET OPERATING MODE.
- 5. Press the CALIBRATION key on the keypad. The word "CAL" will appear on the display for approximately 5 second and then finish with 100.0%.
- 6. The unit is now calibrated and in the normal operating mode.

CAUTION: The device will assume a percent oxygen concentration when calibrating. Be sure to apply 100% oxygen, or ambient air concentration to the device during calibration or the device will not calibrate correctly.

2.3.4 Factors Influencing Calibration

The primary factors influencing the $MaxO_2ME$ Monitor are temperature, pressure, and humidity.

Effects of Temperature

The $MaxO_2ME$ Monitor will hold calibration and read correctly within +/-3% when in thermal equilibrium within the operating temperature range. The device accuracy will be better than +/-3% if operated at the same temperature at which it was calibrated. The device must be thermally stable when calibrated and allowed to thermally stabilize after experiencing temperature changes before reading is accurate. For these reasons, the following is recommended:

- 1. Allow adequate time for the sensor to equilibrate to a new ambient temperature.
- 2. When used in a breathing circuit, place the sensor upstream of the heater.
- 3. For best results, perform the calibration procedure at a temperature close to the temperature where analysis will occur.

Pressure Effect

Readings from the MaxO₂ME Monitor are proportional to the partial pressure of oxygen. The partial pressure of Oxygen (PO₂) is equal to the percentage of oxygen (%O₂) times the absolute pressure (AP) at which the sample environment is measured (PO₂=%O₂ x AP).

Thus the readings are proportional to the concentration if the pressure is held constant. Flow rate of sample gas can affect pressure at the sensor in that back pressure at the sensing point may change. For these reasons, the following is recommended:

- 1. Calibrate the MaxO₂ME Monitor at the same pressure as the sample gas.
- 2. If sample gases flow through tubing, use the same apparatus and flow rates when calibrating as when measuring.

Humidity Effect

The MaxO₂ME Monitor can be used in applications where the relative humidity of the sample gas ranges from 0 to 95%, non-condensing. However, it should be noted that water vapor exerts its own pressure in the same manner as oxygen does in a sample gas stream.

For example, if the monitor is calibrated in dry gas and then the gas is humidified, the monitor will correctly display a reading which is slightly lower than previously displayed. This is due to the dilution of oxygen in the sample gas by water vapor.

This fact is important to note in systems where there exist both "wet" and "dry" gas streams such as in a ventilator circuit. If the monitor is measuring oxygen on the "dry side" of the ventilator, it will correctly indicate an oxygen concentration slightly greater than actually found in the "wet side" (delivered to the patient). The water vapor has diluted the gas stream.

Additionally, gas streams of high humidity may tend to condense on the sensor. Condensation on the sensor may eventually affect performance. For this reason, it is recommended that the sensor be mounted in a vertical position, facing downward to prevent condensate from flowing onto the sensing surface.

∴ 3.0 OPERATING INSTRUCTIONS

3.1 Alarm Setting Procedure

3.1.1 Low Alarm Setting

To adjust the low alarm setting:

- 1. Press the Un-lock key 1 to unlock the keypad. Note the LOW, Smart Alarm, CAL and HIGH icons will begin to flash indicating the SET OPERATING MODE.
- 2. Press the DOWN (LOW ALARM) key **O** on the keypad.

NOTE: the Low Alarm digits begin to flash indicating the Low Alarm manual setting.

3. Use the UP and DOWN keys to set the low alarm to the desired value. Pressing the arrow keys changes the value in 1% increments. If the keys are held down for more than 1 second the display will scroll at a rate of 1% per second.

NOTE: If 30 seconds elapse between key actuations, the system will store the latest low alarm value and will revert to normal operation. If this occurs inadvertently, simply repeat the alarm setting procedure.

There is a special condition that allows the low oxygen alarm to be set below 18%. To access this condition press the DOWN arrow key for three seconds while the low alarm reading displays 18%. The alarm setting can now be adjusted to 17, 16, or 15%. A bar will blink above the setting to provide further indication that the alarm has been set to this special <18% condition.

The low alarm value cannot be set lower than 15%, nor can it be set closer than 1% from the high alarm value. For example, if the high alarm is set at 25%, the system will not accept a low alarm setting greater than 24%.

4. When the low alarm value is set, press the Un-lock key (1) to accept the low alarm setting and return to normal operation.

NOTE: The default low alarm setting is $18\% O_2$. Removing the batteries or shutting the unit OFF will reset the low alarm limit to 18% if it is set to <18%.

3.1.2 High Alarm Setting

To adjust the high alarm setting:

- 1. Press the Un-lock key 1 to unlock the keypad. Note the LOW, SMART ALARM, CAL and HIGH icons will begin to flash indicating the SET OPERATING MODE.
- 2. Press the UP (HIGH ALARM) \(\oldsymbol{O} \) key on the key pad.

NOTE: The High Alarm digits begin to flash indicating the High Alarm manual setting.

3. Use the UP and DOWN keys to set the high alarm to the desired value. Pressing the arrow keys changes the value in 1% increments. If the keys are held down for more than 1 second the display will scroll at a rate of 1% per second.

NOTE: If 30 seconds elapse between key actuations, the system will store the latest high alarm setting and will revert to normal operation. If this occurs inadvertently, simply repeat the alarm setting procedure.

When the high alarm setting is set above 100% the high alarm will indicate two dashes - -. This special condition turns off or deactivates the high alarm.

4. When the high alarm value is set, press the Un-lock key (1) again to accept the high alarm setting and return to normal operation.

NOTE: The default high alarm setting is 50% O₂. Removing the batteries will reset the high alarm limit to 50%.

3.1.3 Smart Alarm Mode

- 2. Press the Smart Alarm \(\begin{align*} \) key on the keypad. Note the LOW digits, Alarm Mode and HIGH digits begin a slow flash indicating SMART ALARM MODE. The high alarm will now be set to be equal to the current oxygen reading +3% (rounded to the nearest interger). The low alarm will now be set to be equal to the current oxygen reading -3% (rounded to the nearest integer but never lower than 18%).

- 3. Pressing the Up key will add one to the high alarm setting and subtract one from the low alarm setting. Pressing the Down key will subtract one from the high alarm setting and add one to the low alarm setting. In other words, the Up Arrow widens the alarm band and the down arrow tightens the alarm band. This feature will not set the alarm levels above 100% or below 18%.
- 4. Once the desired alarm settings are attained, press the Un-lock (a) key to save the settings and return to normal operation mode. If 30 seconds elapse without a key press by the user, the device will automatically save the new alarm settings and return to normal operation mode.

3.2 Basic Operation

To check the oxygen concentration of a sample gas:

- 1. Using the ON/OFF key **(**), make sure the unit is in the power on mode and properly calibrated.
- 2. Place the external flow diverter in the sample gas stream. When using a standard "T" adapter, make sure the sensor is mounted in the adapter with the flow diverter pointing downward. This will prevent moisture from potentially draining into the sensor membrane.

NOTE: It is important that a tight fit exists between the diverter and the "T" adapter.

3. Initiate flow of the sample gas to the sensor.

3.3 Alarm Conditions and Priorities

In the event of either a low alarm or high alarm condition, the corresponding LED will begin to flash, accompanied by the audio buzzer. Pressing the SILENT key will deactivate the buzzer but the LED and the alarm value digits on the display will continue to flash until the alarm condition has been rectified. If the alarm condition still exists 120 seconds after silencing the audio buzzer, the beeper will start to sound again.

A low alarm condition will remain until the actual concentration is 0.1% higher than the low alarm setting. A high alarm condition will remain until the the actual concentration is 0.1% lower than the high alarm setting.

To help differentiate the level of severity, the Monitor provides three unique audible sequences.

Alarm	Alarm Priority	Low Alarm LED (add symbol)	High Alarm LED (add symbol)	Audible Alarm	Audible Alarm Repeat
Line Power Plugged In	Informational	Off	Off	2 Pulses	No Repeat
Line Power Unplugged	Informational	Single Yellow Pulse	Single Yellow Pulse	2 Pulses	No Repeat
External DC Power Supply voltage out of range	Informational	Solid Yellow	Solid Yellow	2 Pulses	Every 15 Sec.
Battery Voltage too low for device to operate (E04)	Medium	Pulsing Yellow	Pulsing Yellow	3 Pulses	Every 25 Sec.
Oxygen level above the high oxygen alarm setting	Medium	Off	Pulsing Yellow	3 Pulses	Every 25 Sec.
Oxygen level below the low oxygen alarm setting	Medium	Pulsing Yellow	Off	3 Pulses	Every 25 Sec.
Oxygen level below the low oxygen alarm setting and lower than 18%	High	Pulsing Red	Off	5+5 Pulses	Every 15 Sec.

3.4 Backlight Operation

To turn on the backlighting:

- 1. When the unit is on, pressing the Backlight key will turn the backlighting on for 30 seconds. Additional presses will turn off the backlighting.
- 2. If the device is being used in a dark location, press any key to activate the back light.

CAUTION: Excessive use of the backlight can reduce the life of the batteries.

3.5 Sleep Mode Operation

To use the sleep mode function:

- 1. Remove the batteries from the unit.
- 2. Locate the sleep mode switch in the battery compartment and set to the ON position.
- 3. Replace the batteries in the unit.

The unit will now perform a normal boot-up operation with sleep mode enabled. With sleep mode enabled the unit will function with all the same parameters as outlined above with one new feature. While in the ON mode, the unit will time-out after 90 seconds to a battery saving condition. This condition will be indicated by a crescent moon on the display. While in this condition any key that is pressed will return the unit to the ON mode and reset the 90 second time-out counter. In sleep mode, the device will continue to monitor the oxygen level and will activate the alarm if an alarm condition occurs.

3.6 External Power Supply Operation

To extend the life of the batteries a Maxtec approved external power supply can be purchased. Once connected to the unit, total power is supplied by the external power supply. The batteries are still required to be in the unit and will provide emergency power in the event main AC power is lost.

NOTE: Use only the Maxtec approved external power supply in Section 9.0 Spare Parts and accessories.

NOTE: The power supply is not a battery charger. **DO NOT** use rechargeable batteries.

∴ 4.0 SENSOR REMOVAL AND REPLACEMENT

The MaxO₂ME is shipped with a new MAX-550E oxygen sensor. Although the sensor has a very long expected life, eventually the sensor will require replacement. Removing or installing a sensor, when necessary, is a very simple procedure.

To remove and install a new sensor:

- 1. Grasp the sensor in one hand and, with the other hand, unscrew the cable connector counter-clockwise at the sensor.
- 2. Pull out the cable connector plug from the expired sensor.
- 3. Unscrew the flow diverter from the sensor and discard the expired sensor or return it to Maxtec for proper disposal.

NOTE: The sensor contains lead and lead acetate, be sure to dispose of expired sensors in accordance with hospital, local, state and federal regulations.

- 4. Remove the new sensor from the packaging and remove the protective film from the sensor face.
- 5. Insert the cable connector plug into the receptacle of the new sensor and tighten the cable connector.
- 6. Screw the flow diverter onto the new sensor.
- 7. Wait approximately 20 minutes for the sensor to reach equilibrium.
- 8. Calibrate the new sensor.

NOTE: If the monitor is on when the sensor is detached and replaced, the monitor will automatically force a re-calibration. The display will read "CAL".

NOTE: If the cable locking nut is not fully fastened onto the sensor, then the sensor may not function properly.

: 5.0 PROBLEM SOLVING

The MaxO₂ME monitors have a self test feature built into the software to detect faulty calibrations, oxygen sensor failures, and low operating voltage. These are listed below, and include possible actions to take, if an error code occurs.

NOTE: The operator must be facing the device and positioned within 4 meters to distinguish the visual alarm indicators. Audible alarms can be distinguished as long as the operator is in the same room and the ambient noise level is typical for a clinical setting.

- » Low Battery Icon [EXT: If the low battery icon is displayed on the LCD readout at any time, the batteries should be replaced as quickly as possible.
- » **E01:** Calibration error, sensor output lower than expected. See note below.
- » E02: No Sensor Attached, disconnect and reconnect external sensor. Unit should

perform an auto calibration, and should read 20.9%. If not, contact Maxtec's Customer Service Department for troubleshooting

- » **E03:** No Valid Calibration Data Available, make sure unit has reached thermal equilibrium and perform a calibration routine.
- » E04: Battery Below Minimum Operating Voltage, replace batteries. A medium priority alarm will sound every 25 seconds until the batteries are replaced or become too dead to sound the alarm.
- » **E05:** Calibration error, sensor output higher than expected. See note below.
- » E06: Non-compatible oxygen sensor.
- » E07: Calibration error, sensor output is not stable. See note below.
- **E08:** Calibration error, battery too low to preform calibration. Replace batteries and re-calibrate

NOTE: If you receive a E01, E05, or an E07 error code, correct by ensuring the calibration gas is either room air or 100% oxygen. Also ensure the calibration gas flow, pressure and concentration is constant. Allow sufficient time for the sensor to stabilize in the calibration gas and with room temperature, then attempt to calibrate again. If these steps do not correct the error, contact Maxtec for technical support.

NOTE: Use only a Maxtec approved Max-550E sensor called out in Section 9.0 of the Spare Parts List. The Max550E sensor is equipped with an authentication chip to ensure the monitor is used with an approved sensor.

After replacing a sensor, if an E06 or E07 is being displayed, please follow the steps below to clear the error.

- 1. Disconnect the sensor and reconnect, making sure the male plug is fully inserted into the receptacle before tightening the threaded locking shroud. The analyzer should now perform a new calibration with the error cleared.
- 2. If the error still persists, remove the batteries and reinstall to reset the device. The analyzer will perform a new calibration with the error cleared.
- 3. Contact Maxtec Customer Service Department if the error code cannot be cleared.

: 6.0 CLEANING AND MAINTENANCE

6.1 Cleaning

The external surfaces of the device and its accessories can be cleaned and disinfected using the process detailed below. Under normal use conditions, the surfaces of the sensor and T-adapter / flow diverter that come in contact with gas delivered to the patient should not become contaminated. If you suspect that the sensing face of the sensor or internal surfaces of the T-adapter / flow diverter have become contaminated, these items should be discarded and replaced. Store the MaxO₂ME in a clean, dry location when not in use.

1. Using Super Sani-Cloth germicidal disposable wipes (medical grade 2-in-1 cleaning / disinfecting wipes) remove all visible contamination from the external surfaces of the device and its accessories. Be sure to closely inspect and remove contamination from seams and recesses on the device that may trap contaminants.

- 2. After all visible contamination is removed, use a second germicidal wipe to thoroughly wet the surfaces of the device and accessories. Allow to remain wet for 4 minutes. Use additional wipes if needed to assure surfaces are wetted continuously for 4 minutes.
- 3. Allow device to air dry.
- 4. Visually inspect each component for visible contamination.

CAUTION: Excessive rubbing of labels may cause them to become illegible.

- **DO NOT** spray cleaning solutions directly onto the monitor, sensor or buzzer opening.
- **DO NOT** immerse the MaxO₂ME or sensor into liquid decontamination agents.
- **DO NOT** use strong solvent cleaners.
- O NOT allow cleaning liquids to contact the face of the sensor as this may impair the readings of the sensor.
- **DO NOT** attempt to sterilize the MaxO₂ME with steam, ethylene oxide or irradiation.

6.2 Alarm Testing

Periodic testing of alarms should be performed on a yearly basis.

To check the low alarm, adjust the low alarm setting to 23% or higher and expose the sensor to room air (20.9%). The low alarm LED should flash with the alarm sound.

To check the high alarm, adjust the low alarm setting to 17% or lower and the high alarm setting to 18% and expose the sensor to room air (20.9%). The high alarm LED should flash with the alarm sound. If one or both alarms malfunction, contact Maxtec Certified Service Technician.

6.3 Replacing Sensor Cable

After extended use or abuse to the sensor cable, the cable may begin to wear and loose its ability to properly retract.

The cable can be removed and replaced by disconnecting the threaded locking shroud at the sensor and monitor ends of the cable. Use only the Maxtec approved cable called out in Section 9.0 of the Spare Parts List.

NOTE: Ensure the cable locking shroud is fully threaded on the sensor and the monitor.

: 7.0 SPECIFICATIONS

7.1 Base Unit Specifications

Measurement Range:	
Resolution:	
Accuracy and Linearity: ±	1% of full scale at constant temperature, R.H.
	and pressure when calibrated at full scale
Total Accuracy: ±3% Actual oxyg	gen level over full operating temperature range
Response Time:	nal value in approximately 15 seconds at 23°C
Warm-up Time:	none required
Operating Temperature:	15°C - 40°C (59°F - 104°F)
Storage Temperature:	15°C - 50°C (5°F - 122°F)
Atmospheric Pressure:	800-1013 mBars
Humidity:	0-95% (non-condensing)
Power Requirements:	4, AA Alkaline batteries (4 X 1.5 Volts)
Battery Life:	approximately 5000 hours in typical use
Low Battery Indication:	"LOW BAT" icon displayed on LCD

Sensor Type:	Maxtec MAX-550E galvanic fuel cell
	>1,500,000% O ₂ Hours over 2 years in typical applications
Alarm System:	high/low alarms, flashing yellow LEDs,
	nominal 975Hz audio buzzer
	(according to IEC 60601-1-8 Audible Alarms in Medical Equipment)
Low Oxygen Alarm Range:	
High Oxygen Alarm Range:	
	exact to displayed alarm value
Dimensions:	3.6"(W) x 5.8"(H) x 1.2"(D) [91mm x 147mm x 30mm]
Weight:	approximately 0.89 lbs. (.40 kg)
Cable Length:	
Diverter Fitting:	fits industry standard, 15 mm "T" adapter
7.2 Sensor Specificatio	ns
	galvanic fuel sensor (0-100%)

: 8.0 APPLICATIONS

8.1 Exposure to Anesthetic Gases

Because of the unique chemistry of the oxygen sensors provided with the MaxO₂ME Monitor, there are no significant effects when exposed to commonly used anesthetic gases, however, the monitor is not designed for exposure to flammable gas mixtures (See WARNING page II).

Interferent	Volume % Dry	Interference in O ₂ %
Nitrous Oxide	60%, balance O ₂	<1.5%
Halothane	4%	<1.5%
Enflurane	5%	<1.5%
Isoflurane	5%	<1.5%
Helium	50%, balance O ₂	<1.5%
Sevoflurane	5%	<1.5%
Desflurane	15%	<1.5%

NOTE: Balance mixture 30% 0₂/70%N₂O, unless otherwise specified

8.2 Calibration Techniques in Pressurized Systems

Similar to other oxygen sensors, the Maxtec MAX series sensors measure the partial pressure of oxygen in a gas stream. This is correlated to read "percent oxygen" on the MaxO₂ME Monitor. It is important to note that the sensor output is directly proportional to the partial pressure of oxygen. Thus, one must take into consideration the effect of exposing the sensor to various gas sample pressures.

For example, if a monitor is calibrated to read 20.9% in ambient air (atmospheric pressure) and then exposed to a pressurized gas sample containing a known concentration of oxygen, the monitor will display a reading

greater than the actual oxygen percentage.

This is because the monitor was originally calibrated at atmospheric pressure (0 PSIG) then exposed to a higher pressure sample (i.e., 5 PSIG).

The greater the difference in pressure, the greater the difference in sensor signal (oxygen reading on the monitor).

If a monitor is calibrated on a pressurized gas sample containing a known concentration of oxygen and then exposed to ambient air (atmospheric pressure), the monitor will display a reading less than the actual oxygen percentage. To avoid confusion, the monitor can be calibrated at a single point on a gas stream similar to the application. If, for example, the purpose of the monitor is to measure oxygen in a concentrator or anesthesia application, the optimal results may be attained by calibrating the instrument on a gas of similar concentration and pressure. This would typically be done by connecting to a cylinder of a known high concentration of oxygen calibration gas and adjusting the flow and pressure to match the application before calibrating the instrument.

8.3 Calibration Errors

The MaxO₂ME Monitor has a self test feature built into the software to detect faulty calibrations. During calibration, if the signal from the oxygen sensor is outside the limits stored within the instrument's memory, a flashing EO1 or EO5 error code is displayed. The error code is displayed to indicate that either the sensor should be replaced or that there is a fault in the calibration process. A few simple hints can prevent calibration errors. If you try to calibrate the monitor before the reading has stabilized, the EO1 or EO5 error code may appear. For example, if the monitor had just been calibrated on a known high concentration of oxygen source gas and then exposed to ambient air, you should wait until the reading has stabilized.

If you try to calibrate in room air before the sample line has cleared, the sensor may actually be exposed to residual oxygen. The signal from the sensor would still be high and considered out of range for air, thus resulting in an E05 or E07 error code. The proper procedure is to wait for the reading to stabilize before calibration.

Also note that the monitor may sense that the concentration is changing and an EO7 error code will display.

Sensors come supplied with a flow diverter. The flow diverter helps direct the gas in a T-adapter up to the sensor for analysis. The flow diverter should be only used with a flowing gas. When using the sensor in a non-flowing environment, remove the diverter tip.

: 9.0 SPARE PARTS AND ACCESSORIES

Replacement Parts	<u>Description</u>
R140P02	MAX-550E Sensor
R228P87	Battery Cover
R228P16	Sensor Cable
R228P10	Kickstand

R230P10 Maxtec Approved External Power Supply

Repair of this equipment must be preformed by a Maxtec Certified Service Technician experienced in repair of portable hand held medical equipment.

Equipment in need of repair should be sent to:

Maxtec Service Department 2305 South 1070 West Salt Lake City, Ut 84119 1.800.748.5355

(Include RMA number issued by Customer Service)

NOTE: The latest edition of this operating manual can be downloaded from our website at **www.maxtec.com**

9.1 Electromagnetic Compatibility

The information contained in this section (such as separation distances) is in general specifically written with regard to the MaxO₂ME Monitor. The numbers provided will not guarantee faultless operation but should provide reasonable assurance of such. This information may not be applicable to other medical electrical equipment; older equipment may be particularly susceptible to interference.

NOTE: Medical electrical equipment requires special precautions regarding electromagnetic compatibility (EMC) and needs to be installed and put into service according to the EMC information provided in this document and the remainder of the instructions for use this device.

Portable and mobile RF communications equipment can affect medical electrical equipment.

Cables and accessories not specified within the instructions for use are not authorized. Using other cables and/or accessories may adversely impact safety, performance and electromagnetic compatibility (increased emission and decreased immunity).

Care should be taken if the equipment is used adjacent to or stacked with other equipment; if adjacent or stacked use is inevitable, the equipment should be observed to verify normal operation in the configuration in which it will be used.

ELECTROMAGNETIC EMISSIONS				
This equipment is intended for use in the electromagnetic environment specified below. The user of this equipment should assure that is used in such an environment.				
EMISSIONS	COMPLIANCE ACCORDING TO	ELECTROMAGNETITC ENVIRONMENT		
RF emissions (CISPR 11)	Group 1	The MaxO2ME uses RF energy only for its internal function. Therefore, its RF emissions are very low and are not likely to cause any interference in nearby electronic equipment.*		
CISPR Emissions Classification	Class A	The MaxO2ME is suitable for use in all establishments other than domestic and those directly connected to the public		
Harmonic emissions (IEC 61000-3-2)	Class A	low-voltage power supply network that supplies buildings used for domestic purposes.		
Voltage fluctuations / flicker (IEC 61000-3-3)	Complies			

ELECTROMAGNETIC IMMUNITY

This equipment is intended for use in the electromagnetic environment specified below. The user of this equipment should assure that is used in such an environment.

IMMUNITY AGAINST	IEC 60601-1-2 TEST LEVEL	COMPLIANCE LEVEL (OF THIS DEVICE)	ELECTROMAGNETITC ENVIRONMENT
electrostatic discharge, ESD (IEC 61000-4-2)	contact discharge: ± 6 kV air discharge: ± 8 kV	± 6 kV ± 8 kV	Floors should be wood, concrete or ceramic tile. If floors are covered with synthetic material, the relative humidity should be kept at levels to reduce electrostatic charge to suitable levels.
electrical fast transients / bursts (IEC 61000-4-4)	power supply lines: ± 2 kV longer input / output lines: ± 1 kV	± 2 kV ± 1 kV	Mains power quality should be that of a typical commercial or hospital environment.
surges on AC mains lines (IEC 61000-4-5)	Common mode: $\pm 2 \text{ kV}$ differential mode: $\pm 1 \text{ kV}$	± 2 kV ± 1 kV	Mains power quality should be that of a typical commercial or hospital environment.
power frequency magnetic field 50/60 Hz (IEC 61000-4-8)	3 A/m	3 A/m	Equipment which emits high levels of power line magnetic fields (in excess of 3A/m) should be kept at a distance to reduce the likelihood of interference.
voltage dips and short interruptions on AC mains input lines (IEC 61000-4-11)	dip >95%, 0.5 periods dip 60%, 5 periods dip 30%, 25 periods dip >95%, 5 seconds	>95%, 0.5 per. 60%, 5 per. 30%, 25 per. >95%, 5 sec.	Mains power should be that of a typical commercial or hospital environment. If user requires continued operation during power mains interruptions insure that batteries are installed and charged. Insure that battery life exceeds longest anticipated power outages or provide and additional uninterruptible power source.

Recommended separation distances between portable and mobile RF communications equipment and the equipment

RATED MAXIMUM	Separation distance according to frequency of transmitters in meters			
OUTPUT POWER OF TRANSMITTER W	150 kHz – 80 MHz d=1.2/V1]√P	80 MHz to 800MHz d=1.2/V1]√P	800 MHz to 2.5 GHz d=2.3√P	
0.01	0.12	0.12	0.23	
0.1	0.38	0.38	0.73	
1	1.2	1.2	2.3	
10	3.8	3.8	7.3	
100	12	12	23	

For transmitters rated at a maximum output power not listed above, the recommended separation distance *d* in meters (m) can be estimated using the equation applicable to the frequency of the transmitter, where *P* is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

 $\textbf{NOTE 1:} \ \text{At 80 MHz and 800 MHz}, the separation distance for the higher frequency range applies}.$

NOTE 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

This equipment is intended for use in the electromagnetic environment specified below. The customer or the user of should assure that it is used in such an environment. IMMUNITY TEST IEC 60601 TEST LEVEL COMPLIANCE ELECTROMAGNETIC ENVIRONMENT – GUIDANCE I FVFI Portable and mobile RF communications equipment should be used no closer to any part of the, including cables, than the recommended separation distance calculated from the equation applicable to the frequency of the transmitter as below. Recommended separation distance Conducted RF 150 kHz to 80 MHz 3 Vrms d=1.2√P rf coupled into lines outside ISM bandsa (IEC 61000-4-6) Radiated rf 3 V/m 3 V/m d=1.2/√P 80 MHz to 800 MHz (IEC 61000-4-3) 80 MHz - 2.5 GHz d=2.3√P 800 MHz to 2.5 GHz where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and d is the recommended separation distance in metres (m). Field strengths from fixed RF transmitters, as determined by an electromagnetic site surveya, should be less than the compliance level in each frequency rangeb. Interference may occur in the vicinity of equipment marked with the following symbol: ((<u>(</u>))

 $_{\rm a}$ The ISM (industrial, scientific and medical) bands between 150 kHz and 80 MHz are 6,765 MHz to 6,795 MHz; 13,553 MHz to 13,567 MHz; 26,957 MHz to 27,283 MHz; and 40,66 MHz to 40,70 MHz.

^a Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the equipment is used exceeds the applicable RF compliance level above, the equipment should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as reorienting or relocating the equipment.
