

Description of Device.

Generic name of device: Transparent Plastic Basinet Covers

Model name: Cot Lid

Model number: PP8000 Series

Brief description of device and other devices designed to be used in combination with it:

They are normally manufactured from transparent Acrylic (Perspex), flat and hinged in the middle, with or without louvers, usually used to cover standard bassinets used in hospitals.

The cot lid is used in conjunction with a basinet to reduce heat loss in an infant. It is used in non-critical situations when an incubator would be inappropriate. It is available in a version with a built in louver.

In order to prevent breakage of the Cot Lids by infants kicking the flap extending over basinet, the cot lid has been extended and bent back under the cot lid edge. This will prevent the infant dislodging the lid.

Standard sizes are available.

Specials can be manufactured to order.

- Specials are manufactured to the user specification; all follow the basic description.
