

### **Design History**

This product is based on a range of similar products designed by hospitals in the early 1960's, and has been continually improved in line with medical practices.

The Tube Holder is a means of maintaining an open working environment for the clinicians, thus not being hampered by overlaying and intrusive tubes when treating babies.

It has been developed continuously since then.

In the mid 1980's, it was constructed by Tanda & Co. (formally Appleyards & Son) of Yeadon, Leeds. They are a small engineering company, who have developed the product, and the manufacturing techniques.

Since 1996, Tanda & Co (Appleyards), have produced a product of good consistent quality with no user complaints.
