Company CONFIDENTIAL	Communication Protocol	Page 3 of 17

1 Transmission characteristics

1.1 Physical layer

Serial UART interface:

- Baud rate is variable, default: 115200 Bd
- 1 start bit, 8 data bits, 1 stop bit, no parity bits (8-N-1)
- No hard or software handshake is used

1.1 Data-link layer

The data sent to the SMARTsat® module and received from it, is transmitted as packet. Each packet consists of a number of bytes. In general the SMARTsat® protocol is based on the „Serial Line Internet Protocol“.

The SMARTsat® module data packets are sent continuously. The package structure is described in section 2.2.

The host command packets are sent occasionally as needed. The package structure is similar to the SMARTsat® module data packets, however no frame counter is sent and the identifier is linked with the attribute 0x80 OR (see section 2.3).

2 Data packet structure

Each data packet received from SMARTsat® or command sent to the SMARTsat® has the following structure:

Packet			
Start Flag	Frame		End Flag
Start Flag	Data	CRC16	End Flag

2.1 Data packet description

Start Flag	Data	CRC16	End Flag
------------	------	-------	----------

Name	Description	Size
Start flag	Indicates the beginning of a frame: 0xA8	1 byte
Data	Data field	variable
CRC16	CRC16 data verification as indicated below from all characters in the field 'Packet'. Send: High byte first	2 bytes
End flag	Indicates the end of a packet: 0xA8	1 byte

	SMARTsat® OEM I / II / III	Rev. 9
Company CONFIDENTIAL	Communication Protocol	Page 4 of 17

2.2 Read frames (Data sent by SMARTsat®)

2.2.1 Start and end flags

Start and end flags are used to find single frames in the data stream.

Start flag: 0xA8	Frame		End flag: 0xA8
Start flag: 0xA8	Data	CRC16	End flag: 0xA8

Both flags have the value **0xA8**. Find the bytes between the **0xA8** in the data stream to identify a frame. If there is no data between the **0xA8**, it is the start of a frame. In the next step the frame requires de-stuffing (see section 2.2.2)

2.2.2 Byte stuffing

Flag	Frame	Flag
------	-------	------

SMARTsat® uses a byte-stuffing algorithm on each frame to ensure that no 0xA8 is transmitted within the frame.

The reserved value 0xA8 is used for the start and end flags. The second reserved character is the control byte with value 0xA9. If in the block “data” or “checksum” a character appears, which is the same, as one of the flags or the control byte, it is coded with two bytes.

First, the control byte is transmitted, and the second byte is the original data byte AND-linked with 0xDF (byte stuffing).

0xA8 is coded as 0xA9, 0x88.

0xA9 is coded as 0xA9, 0x89.

The host can then clearly detect where one packet ends and the next one begins because **0xA8** is reserved to the start and end flags and will never show up within the frame.

If in the received data stream a control byte is detected, it is to be ignored and the following byte is to be linked with 0x20 OR (de-stuffing).

E.g.:

Packet sent by SMARTsat®	A8 FE 10 02 2A 32 3D 4B 5C 6C 7E 8F 9E A9 89 AF B0 AE A9 88 A1 00 80 A4 7E A8
Frame which must be de-stuffed	FE 10 02 2A 32 3D 4B 5C 6C 7E 8F 9E A9 89 AF B0 AE A9 88 A1 00 80 A4 7E
Frame after de-stuffing	FE 10 02 2A 32 3D 4B 5C 6C 7E 8F 9E A9 AF B0 AE A8 A1 00 80 A4 7E

After de-stuffing calculate the CRC according to section 2.2.3 to ensure data validity.

	SMARTsat® OEM I / II / III	Rev. 9
Company CONFIDENTIAL	Communication Protocol	Page 5 of 17

2.2.3 CRC16 data verification

The integrity of the data received is verified by calculating the CRC16 check value of the “DATA” field and comparing it with the CRC16 check value sent in the frame. 0xFFFF is the starting value.

Start flag	Data	CRC16	End flag
------------	------	-------	----------

Example for CRC16 (cyclic redundancy check) in C:

```
const unsigned short wCRCTableAbs[] =
{
    0x0000, 0xCC01, 0xD801, 0x1400, 0xF001, 0x3C00, 0x2800, 0xE401,
    0xA001, 0x6C00, 0x7800, 0xB401, 0x5000, 0x9C01, 0x8801, 0x4400,
};

unsigned short _Data2CRC16(char *pchMsg, unsigned short wDataLen )
{
    unsigned short i, wCRC = 0xFFFF;
    char chChar;

    for (i = 0; i < wDataLen; i++)
    {
        chChar = *pchMsg++;
        wCRC = wCRCTableAbs[(chChar ^ wCRC) & 15] ^ (wCRC >> 4);
        wCRC = wCRCTableAbs[((chChar >> 4) ^ wCRC) & 15] ^ (wCRC >> 4);
    }

    return wCRC;
}
```

2.2.4 SMARTsat® data

The DATA sent by the SMARTsat® has the following structure:

Flag	Data				CRC16	Flag
Flag	Frame counter	Data channel-ID	Identifier	Value	CRC16	Flag
1 byte	1 byte	1 byte	1 byte	various bytes	2 bytes	1 byte

2.2.4.1 Frame counter:

Each data packet sent from the SMARTsat® module is consecutively numbered (frame counter).

Flag	Frame counter	Data channel-ID	Identifier	Value	CRC16	Flag
------	---------------	-----------------	------------	-------	-------	------

The frame counter is used to detect data packets lost during data transmission. The frame counter is an unsigned 8 bit value ranging from 0 to 255. It begins with 0 and is incremented with each data block. After reaching the frame counter 255, the next number will be set to 0, and so on.

	SMARTsat® OEM I / II / III	Rev. 9
Company CONFIDENTIAL	Communication Protocol	Page 6 of 17

2.2.4.2 Data channel ID

The protocol differentiates the data by using a data channel ID.

Flag	Frame counter	Data channel-ID	Identifier	Value	CRC16	Flag
------	---------------	-----------------	------------	-------	-------	------

The following channels are available:

Data channel ID	Name	Description
0x01	Common device information	Identifies the module hardware and firmware
0x02	Error channel	List of errors detected by SMARTsat®
0x10	SMARTsat® channel	Channel for configuration of SMARTsat® and receiving the measurement results and parameters.

2.2.4.3 Identifier

The data identifier is used to differentiate the different module parameters and values sent within each data channel. Possible identifiers for each Data Channel are listed in the sections 3 to 5.

Flag	Frame counter	Data channel-ID	Identifier	Value	CRC16	Flag
------	---------------	-----------------	------------	-------	-------	------

2.2.4.4 Data values

The relevant information transported by the data package is coded in the VALUE of the Common device information channel (see section 3) and the SMARTsat® channel (see section 5).

Flag	Frame counter	Data channel-ID	Identifier	Value	CRC16	Flag
------	---------------	-----------------	------------	-------	-------	------

In case of the Error channel, the relevant information is coded in the IDENTIFIER (see section 4)

2.3 Commands sent by host

2.3.1 Build frame

Building frames is done in reverse order to reading the frames. First identify data to be sent (see section 5). Link the identifier with the attribute 0x80 OR.

Now calculate the CRC16 (section 2.2.3) to complete the frame.

Perform byte stuffing on the complete frame (section 2.2.2), thereafter add the start and end flag.

The command package is ready to be sent to the SMARTsat®.

2.3.2 Command

Commands sent by the host to SMARTsat® must be sent in the following data packet structure:

Flag	Data			CRC16	Flag
Flag	Data channel-ID	Identifier OR 0x80	Value	CRC16	Flag

The time between two consecutive commands sent to SMARTsat® has to be larger than 100ms. The SMARTsat® confirms the command. Send the command again, if the command is not confirmed within 100ms.

	SMARTsat® OEM I / II / III	Rev. 9
Company CONFIDENTIAL	Communication Protocol	Page 7 of 17

The data included in a command package is described in the table below.

Item	Description for commands sent by host (refer to section 2.2.4 for description of the SMARTsat® data structure)
Frame counter	NOTE: No frame counter is included in the command packages sent by the host to SMARTsat®
Data channel ID	Commands sent by the host and data sent by SMARTsat® use the same data channel ID. Refer to section 2.2.4.2.
Data identifier	For commands sent by the host the data identifier is linked with the attribute 0x80 OR . Possible identifiers for each Data Channel are listed in the sections 3 to 5. e.g. host identifier = 0x31 0x80 = 0xB1 NOTE: For messages from SMARTsat® to the host (Answer), the Identifier has no attribute and the relevant information follows in further bytes.
Command value	A command is sent by the host to SMARTsat® to change a mode or to ask for the current setting. A VALUE is included in the data package, depending on the type of request.

2.3.3 Change mode

Different measurement modes are available. The host can select a mode by setting the relevant mode VALUE (see section 5, column “Host command” at least 1 Byte).

Flag	Data channel-ID	Identifier OR 0x80	Value	CRC16	Flag
------	-----------------	---------------------------	-------	-------	------

A summary of selectable measurement modes in SMARTsat® channel 0x10 are listed in the table below.

Mode Name	Identifier at SMARTsat® channel 0x10 *
Response time setting (SpO ₂ and Pulse Rate)	0x10
High Resolution Plethysmogram (HRP) mode	0x11
Pulse rate mode	0x12
Status information send frequency	0x17
Auto scaled plethysmogram on/off	0x18
Baud rate setting	0x31

* Refer to section 5 for a detailed description of possible settings.

2.3.4 Request current setting

At any time the host can ask for the current setting within the SMARTsat® channel or request common device information. In this case no VALUE is included in the package.

Flag	Data channel-ID	Identifier OR 0x80	CRC16	Flag
------	-----------------	---------------------------	-------	------

Example in HEX - Request which sensor type is connected:

A8 10 86 D2 8D A8

Also see section 5, column: “Host command size” is set to 0 Byte in case an identifier can be requested. If set to n.a. a request is not provided.

3 Common device channel 0x01

Description		Length of value	
Identifier	Value	SMARTsat® data	Host command
0x01	Protocol version as string E.g. "rev. 7"	variable	0 Bytes
0x02	Device identification as string E.g. "03" = SMARTsat®	variable	0 Bytes
0x03	Firmware version as string E.g. "BM.03.B19.A14.1X"	variable	0 Bytes
0x04	Hardware version as string E.g. "V3.3.1 Rev.A"	variable	0 Bytes
0x05	Serial number as string E.g. "1625320094"	10 Bytes	0 Bytes
0x06	Sent once at device start-up NOTE: at repeated reset of the module the host is recommended to display message "Device Defective". A typical reasons for reset of the module is an unstable or fluctuating supply voltage	0 Bytes	NA

NOTE: Each time the module is switched on (also after reset) it will send the start-up frame, firmware version and serial number.

Example in HEX at start-up for FW "BM.03.B19.A14.1X" and SN "1625320094":

Start-up frame: A8 00 01 06 52 F0 A8

FW: A8 01 01 03 42 4D 2E 30 33 2E 42 31 39 2E 41 31 34 2E 31 58 B7 CE A8

SN: A8 02 01 05 31 36 32 35 33 32 30 30 39 34 7C 01 A8

4 Error channel 0x02

If the SMARTsat® module receives faulty data packets or detects an internal module error, the corresponding error message will be sent to the host. The SMARTsat® module does not accept any messages on this channel.

Error messages are transmitted for the duration of error occurrence at 1 Hz on the data channel 0x02 according to the structure below.

Flag	Frame counter	0x02	Identifier	CRC16	Flag
------	---------------	------	------------	-------	------

The errors are listed in the table below.

	SMARTsat® OEM I / II / III	Rev. 9
Company CONFIDENTIAL	Communication Protocol	Page 9 of 17

Error channel 0x02:

Identifier	Error	Description
0x01	Unknown channel	SMARTsat received a command with unknown channel.
0x02	Unknown identifier	SMARTsat received a command with unknown channel.
0x03	Invalid value	SMARTsat received a command with invalid value (e.g. a not defined baud rate)
0x04	Selected baud rate is too slow	HRP150 and HRP300 need a minimum baud rate of 115200 Bd Increase baud rate if HRP150 or HRP300 is selected.
0x05	Receive buffer overflow	SMARTsat is receiving too much data
0x06	Frame corrupt, CRC error	SMARTsat is receiving data packets with Frame corrupt or CRC error
0x07	Sensor Error: Red LED defective	The red LED at the sensor is defective. NOTE: status information 'Sensor defective' (Byte[0] Bit: 1 in channel 0x10, identifier 0x01) is sent at the same time .
0x08	Sensor Error: Infrared LED defective	The infrared LED at the sensor is defective. NOTE: status information 'Sensor defective' (Byte[0] Bit: 1 in channel 0x10, identifier 0x01) is sent at the same time .
0x09	Sensor Error: Photodiode defective	The detector at the sensor is defective. NOTE: status information 'Sensor defective' (Byte[0] Bit: 1 in channel 0x10, identifier 0x01) is sent at the same time .
0x0A	Sensor Error: Short circuit	Short circuit occurred in the sensor cable or connector. Measurement is interrupted. Disconnect sensor to reset the error.
0x10	Boot error	The boot-test during module switch-on was failed.
0x11	Self-test error	During module switch-on a self-test is performed. This error is sent if the self-test failed
0x12	Buffer overflow	An internal buffer overflow error occurred. Reset module, if the error message repeats display technical error message for at least 1 second upon occurrence of the error
0x13	Command to switch on auto scaled plethysmogram is not accepted	Auto scaled plethysmogram and HRP cannot be switched on simultaneously. In HRP mode the auto plethysmogram is not available. The error code will show up, if the host enables auto plethysmogram in HRP mode. Switch of HRP before switching on the auto scaled plethysmogram

Example in HEX:

The following package is sent by SMARTsat® if the host sends a command with unknown identifier:

A8 53 02 02 70 01 A8

5 SMARTsat® channel 0x10

Identifier	Value (*for description to build the Host Command see section 2.3.4)	SMARTsat®		* Host Command size

6 Examples

6.1 Change baud rate

In this example, the host changes the baud rate of SMARTsat® module from 115200 Bd to 9600 Bd:

Command from host to SMARTsat® module (at 115200 Bd)

Start flag	Channel	Identifier	Value	CRC16 Hi	CRC16 Lo	End flag
0xA8	0x10	0xB1	0x60	0x7D	0x04	0xA8

Confirmation from SMARTsat® module to host (at 115200 Bd)

Start flag	Frame counter	Channel	Identifier	Value	CRC16 Hi	CRC16 Lo	End flag
0xA8	0x01	0x10	0x31	0x60	0xA5	0x15	0xA8

After approximately 1 second the new baud 9600 is valid.

6.2 UART send / receive in C

```

/*
The following C language functions send and receive SMARTsat® packets.
They depend on two functions, send_char() and recv_char(), which send
and receive a single character over the serial line.
*/

/* SMARTsat special character codes
*/
#define END          0xA8    /* indicates end of packet */
#define ESC          0xA9    /* indicates byte stuffing */

HRP = High Resolution Plethysmogram

EPR = Enhanced Pulse Rate

Rev	Date	Name	Change description	Review
0	2014-Dec-15	UT	Initial version	-
1	2014-Dec-19	UT	First Version for Integration Guide based on Multiwave Protocol rev. 1	-
2	2015-Dec-08	PK	<ul style="list-style-type: none"> - Combined version for SMARTsat® OEM I – III (based on Multiwave Protocol rev.2) - Removed: electrical properties of serial interface (part of Integration Guide) - Add: EPR 150 Hz, 300 Hz, example for destuffing, sensor types 	UT
3	2016-Feb-19	PK	<ul style="list-style-type: none"> - Changed: Format, length and examples for common device channel 0x01 - Add: HRP data send order, Pulse beep pointer bit positions, SpO2 send order, Status send order, Sensor type send order 	WT, HF
4	2016-Mar-03	HF	<ul style="list-style-type: none"> - Rename section 1, 2, 3, headers of tables - Add 1.1 Data link layer, add 1.2 Data package structure - Change images at “Auto scaled plethysmogram”, “HRP” <ul style="list-style-type: none"> - Add HEX values (not only decimal) to table under SMARTsat® channel 	WT, PK
5	2016-Mar-08	HF	<p>Add Features:</p> <ul style="list-style-type: none"> - send single HRP data samples (3 Byte, before 45 Byte) - switch Auto scaled plethysmogram (ID 0x02) on/off - transmission frequency of status selectable from 5Hz to 1Hz - remove sending ID 0x10, 0x12 at 1Hz, add sending these settings at ID 0x04, 	WT, PK
6	2016-Mar-14	HF	<ul style="list-style-type: none"> - Add description on how commands are send by host (section 2.3) - Add examples in HEX at “Common device channel”, “Error channel” - Add examples in C for “UART send/receive” and “build frame to switch on HRP” 	WT
7	2016-Aug-24	HF	<ul style="list-style-type: none"> - Add Identifier 0x06 in Common device channel 0x01 - Add Identifiers 0x07, 0x08, 0x09 and 0x13 in Error channel 0x02 - Add Bit 7 at Identifier 0x01 of SMARTsat® channel 0x10 - Add Bit 7 at Byte 6 of Identifier 0x04 in SMARTsat® channel 0x10 - Update the Sensor Type ID (backward compatible) - Add information that HRP needs to be switched off before auto scaled pleth can be switched on again - update examples in HEX 	PK, HG, JPB
7 - A	2016-Sept-06	HF	<ul style="list-style-type: none"> - corrected typos - Add description to error channel (section 2) 	PK, HG, JPB, WT, UT
8	2017-Jan-31	HF	<ul style="list-style-type: none"> - Add Identifier 0x0A (Sensor Error: Short circuit) to Error channel. Measurement is interrupted and error is sent together with “sensor defective status” if SMARTsat detects short at sensor LED. (Before measurement was interrupted and status “sensor defective” was sent). 	PK, HG, JPB, WT, UT
9	2017-June-29	WT	<p>NOTE: No change for OEM III compared to rev.8</p> <p>Changes only available for OEM I and II:</p> <ul style="list-style-type: none"> - Add Identifier 0x19 (Switch High Resolution Plethysmogram ON/OFF) - Add Identifier 0x1A (Set sample rate) 	UT, HF
