

Continuous Gas Analyzers, extractive

ULTRAMAT 23

General

Overview

The ULTRAMAT 23 gas analyzer can measure up to 4 gas components at once: A maximum of three infrared sensitive gases such as CO, CO₂, NO, SO₂, CH₄ and in addition O₂ with an electrochemical oxygen measuring cell.

ULTRAMAT 23 basic versions for:

- 1 infrared gas component with/without oxygen measurement
- 2 infrared gas components with/without oxygen measurement
- 3 infrared gas components with/without oxygen measurement

Benefits

- AUTOCAL with ambient air (depends on measured component)
High efficiency so no calibration gas and accessories required
- High selectivity by multiple layer detectors,
e.g. small cross sensitivity to water vapor
- Cleanable sample cells,
cost saving in further use in case of pollution
- Menu-assisted operation in plain text,
operation control without manual, high operator safety
- Service information and log book,
preventive maintenance; help for service and maintenance personnel, cost reduction
- Coded operator level against unauthorized access,
increased safety
- Open interface architecture (RS 485, RS 232; PROFIBUS, SIPROM GA);
simplified process integration, remote control

Application

Application areas

- Optimization of small firing systems
- Monitoring of exhaust gas concentration from firing systems with all types of fuel (oil, gas and coal) as well as operational measurements with thermal incineration plants
- Room air monitoring
- Monitoring of air in fruit stores, greenhouses, fermenting cellars and warehouses
- Monitoring of process control functions
- Atmosphere monitoring during heat treatment of steel
- For use in non-potentially-explosive atmospheres.

Further applications

- Environmental protection
- Chemical plants
- Cement industry.

Special versions

- Separate gas paths
The ULTRAMAT 23 with 2 IR components without pump is also available with two separate gas paths.. This allows the measurement of two measuring points as used e.g. for the NO_x measurement before and after the NO_x converter.
The ULTRAMAT 23 gas analyzer can be used in emission measuring systems and for process and safety monitoring.
- TÜV version/QAL/MCERTS
TÜV-approved versions of the ULTRAMAT 23 are available for measurement of CO, NO, SO₂ and O₂ according to 13. BImSchV/27.BImSch and TA Luft.
Smallest TÜV-approved and permitted measuring ranges:
 - 1- and 2-component analyzer
 - CO: 0 to 150 mg/m³
 - NO: 0 to 100 mg/m³
 - SO₂: 0 to 400 mg/m³
 - 3-component analyzer
 - CO: 0 to 250 mg/m³
 - NO: 0 to 400 mg/m³
 - SO₂: 0 to 400 mg/m³

All larger measuring ranges are also approved.

Furthermore, the TÜV-approved versions of the ULTRAMAT 23 comply with the requirements of EN 14956 and QAL 1 according to EN 14181. Conformity of the analyzers with both standards is TÜV-certified.

Determination of the analyzer drift according to EN 14181 (QAL 3) can be carried out manually or also with a PC using the SIPROM GA maintenance and servicing software. In addition, selected manufacturers of emission evaluation computers offer the possibility for downloading the drift data via the analyzer's serial interface and to automatically record and process it in the evaluation computer.

- Version with reduced response time
The connection between the two condensation traps is equipped with a stopper to lead the complete flow through the measuring cell (otherwise only 1/3 of the flow), i.e. the response time is 2/3 faster. The functions of all other components remain unchanged.
- Chopper compartment flushing: consumption 100 ml/min (upstream pressure: approx. 3 000 hPa).

Continuous Gas Analyzers, extractive

ULTRAMAT 23

General

Design

- 19" rack unit with 4 HU for installation
 - in hinged frame
 - in cabinets with or without telescopic rails
- Flow indicator for sample gas on front plate; option: integrated sample gas pump (standard for bench-top version)
- Gas connections for sample gas inlet and outlet as well as zero gas; pipe diameter 6 mm or 1/4"
- Gas and electrical connections at the rear (portable version: sample gas inlet at front).

Display and control panel

- Operation based on NAMUR recommendation
- Simple, fast parameterization and commissioning of analyzer
- Large, backlit LCD for measured values
- Menu-driven inputs for parameterization, test functions and calibration
- Washable membrane keyboard
- User help in plain text
- 6-language operating software.

Inputs/outputs

- Three binary inputs for sample gas pump On/Off, triggering of AUTOCAL and synchronization of several devices
- Eight relay outputs can be freely configured for fault, maintenance request, maintenance switch, limits, range identification and external solenoid valves
- Eight additional binary inputs and relay outputs as an option
- Electrically isolated analog outputs

Communication

- RS 485 present in basic unit (connection from the rear).

Options

- RS 485/RS 232 converter
- RS 485/Ethernet converter
- RS 485/USB converter
- Incorporation in networks via PROFIBUS DP/PA interface
- SIPROM GA software as service and maintenance tool.

ULTRAMAT 23

General

Function

The ULTRAMAT 23 uses two independent measuring principles which work selectively.

Infrared measurement

The measuring principle of the ULTRAMAT 23 is based on the molecule-specific absorption of bands of infrared radiation, which in turn is based on the "single-beam procedure". An IR source (7) operating at 600 °C emits infrared radiation, which is then modulated by a chopper (5) at 8 1/3 Hz.

The IR radiation passes through the sample chamber (4), into which sample gas is flowing, and its intensity is weakened as a function of the concentration of the measured component.

The sample chamber – set up as a two- or three-layer detector – is filled with the component to be measured.

The first detector layer (11) primarily absorbs energy from the central sections of the sample gas IR bands. Energy from the peripheral sections of the bands is absorbed by the second (2) and third (12) detector layers.

The microflow sensor generates a pneumatic connection between the upper layer and the lower layers. Negative feedback from the upper layer and lower layers leads to an overall narrowing of the spectral sensitivity band. The volume of the third layer and, therefore, the absorption of the bands, can be varied using a "slide switch" (10), thereby increasing the selectivity of each individual measurement.

The rotating chopper (5) generates a pulsating flow in the sample chamber that the microflow sensor (3) converts into an electrical signal.

The microflow sensor consists of two nickel-plated grids heated to approximately 120 °C, which, along with two supplementary resistors, form a Wheatstone bridge. Combined with the dense arrangement of the nickel-plated grids, the pulsating nature of the flow causes a change in the resistance. This leads to an offset in the bridge, which is dependent on the concentration of the sample gas.

Note

The sample gases must be fed into the analyzers free of dust. Condensation should be prevented from occurring in the sample chambers. Therefore, the use of gas modified for the measuring task is necessary in most application cases.

As far as possible, the ambient air of the analyzer should not have a large concentration of the gas components to be measured.

ULTRAMAT 23, principle of operation of the infrared channel (example with three-layer detector)

Continuous Gas Analyzers, extractive

ULTRAMAT 23

General

Automatic calibration with air

The ULTRAMAT 23 can be calibrated using, for example, ambient air. During this process (between 1 and 24 hours (adjustable), 0 = no AUTOCAL), the chamber is purged with air. The detector then generates the largest signal U_0 (no pre-absorption in the sample chamber). This signal is used as the reference signal for zero point calibration, and also serves as the initial value for calculating the full-scale value in the manner shown below.

As the concentration of measured component increases, so too does absorption in the sample chamber. As a result of this pre-absorption, the detectable radiation energy in the detector decreases, and thus also the signal voltage. For the single-beam procedure of the ULTRAMAT 23, the mathematical relationship between the concentration of the measured component and the measured voltage can be approximately expressed as the following exponential function:

$$U = U_0 \cdot e^{-kc}$$

c Concentration

k Unit-specific constant

U_0 Basic signal with zero gas (sample gas without measured component)

U Detector signal

Changes in the radiation power, contamination of the sample chamber, or ageing of the detector components have the same effect on both U_0 and U , and result in the following:

$$U' = U_0' \cdot e^{-kc}$$

Apart from being dependent on concentration c , the measured voltage thus changes continuously as the IR source ages, or with persistent contamination.

Each AUTOCAL tracks the total characteristic until the currently valid value, thereby compensating for temperature and pressure influences.

The influences of contamination and ageing, as mentioned above, will have a negligible influence on the measurement as long as U' remains in a certain tolerance range monitored by the unit.

The tolerance "clamping width" between two or more AUTOCALS can be individually parameterized on the ULTRAMAT 23 and an alarm message output. A fault message is output when the value falls below the original factory setting of $U_0 < 50\% U$. In most cases, this is due to the sample chamber being contaminated.

The units can be set to automatically calibrate the zero point every 1, 2, 3 ... 24 hours using ambient air. Calibration with a calibration gas is not necessary, as the calibration curve is calculated using the new U'_0 value.

Calibration

Oxygen measurement

The oxygen sensor operates according to the principle of a fuel cell. The oxygen is converted at the boundary layer between the cathode and electrolyte. An electron emission current flows between the lead anode and cathode and via a resistor, where a measured voltage is present. This measured voltage is proportional to the concentration of oxygen in the sample gas.

The oxygen electrolyte used is less influenced by interference influences (particularly CO_2 , CO , H_2 and CH_4) than other sensor types.

ULTRAMAT 23, principle of operation of the oxygen measuring cell

ULTRAMAT 23 essential characteristics

- Practically maintenance-free thanks to AUTOCAL with ambient air (or with N_2 , only for units without an oxygen sensor); both the zero point and the sensitivity are calibrated in the process
- Calibration with calibration gas only required every twelve months, depending on the application
- Two measuring ranges per component can be set within specified limits; all measuring range linearized; autoranging with measuring range identification
- Automatic correction of variations in atmospheric pressure
- Sample gas flow monitoring; error message output if flow $< 1 \text{ l/min}$ (only with Viton sample gas path)
- Maintenance request alert
- Two freely configurable undershooting or overshooting limit values per measured component

Continuous Gas Analyzers, extractive

ULTRAMAT 23

19" rack unit and portable version

2

Technical specifications

General

Measured components	Maximum of 4, comprising three infrared-sensitive gases and oxygen
Measuring ranges	Two per measured component
Display	LCD with LED backlighting and contrast control; function keys; 80 characters (4 lines/20 characters)
Operating position	Front wall, vertical
Conformity	CE mark in accordance with EN 50081-1, EN 50082-2

Design, enclosure

Weight	Approximately 10 kg
Degree of protection, 19" rack unit and desktop model	IP20 according to EN 60529

Electrical characteristics

EMC (Electromagnetic Compatibility) (safety extra-low voltage (SELV) with safety isolation)	In accordance with standard requirements of NAMUR NE21 (08/98) or EN 50081-1, EN 50082-2
Auxiliary power	100 V AC, +10%/-15%, 50 Hz, 120 V AC, +10%/-15%, 50 Hz, 200 V AC, +10%/-15%, 50 Hz, 230 V AC, +10%/-15%, 50 Hz, 100 V AC, +10%/-15%, 60 Hz, 120 V AC, +10%/-15%, 60 Hz, 230 V AC, +10%/-15%, 60 Hz
Power consumption	Approx. 60 VA

Electrical inputs and outputs

Analog output	Per component, 0/2/4 up to 20 mA, NAMUR, potential-free, max. load 750 Ω
Relay outputs	8, with changeover contacts, freely parameterizable, e.g. for measuring range identification; 24 V AC/DC/1 A load, potential-free, non-sparking
Binary inputs	3, dimensioned for 24 V, potential-free • Pump • AUTOCAL • Synchronization
Serial interface	RS 485
AUTOCAL function	Automatic unit calibration with ambient air (depending on measured component); adjustable cycle time from 0 (1) to 24 hours
Options	Add-on electronics, each with 8 additional binary inputs and relay outputs for e.g. triggering of automatic calibration and for PROFIBUS PA or PROFIBUS DP

Climatic conditions

Permissible ambient temperature	
• During operation	+5 ... +45 °C
• During storage and transportation	-20 to +60 °C
Permissible ambient humidity	< 90% RH (relative humidity) during storage and transportation
Permissible pressure fluctuations	700 to 1 200 hPa

Gas inlet conditions

Sample gas pressure	
• Without pump	Unpressurized (< 1 200 hPa, absolute)
• With pump	Depressurized suction mode, set in factory with 2 m hose at sample gas outlet; full-scale value calibration necessary under different venting conditions
Sample gas flow	72 to 120 l/h (1.1 to 2 l/min)
Sample gas temperature	0 to 50 °C
Sample gas humidity	< 90% RH (relative humidity), non-condensing

Continuous Gas Analyzers, extractive

ULTRAMAT 23

19" rack unit and portable version

2

Technical data, infrared channel

Measuring ranges	See ordering data
Chopper compartment flushing	Upstream pressure approximately 3 000 hPa; purging gas consumption approximately 100 ml/min

Dynamic response

Warm-up period	Approximately 30 min (at room temperature) (the technical specification will be met after 2 hours)
Delayed display (T_{90} -time)	Dependent on length of analyzer chamber, sample gas line and parameterizable damping
Damping (electrical time constant)	Parameterizable from 0 to 99.9 s

Measuring response

Output signal fluctuation	$< \pm 1\%$ of the current measuring range (see label)
Detection limit	1% of the current measuring range
Linearity error	In largest possible measuring range: $< \pm 1\%$ of the full-scale value In smallest possible measuring range: $< \pm 2\%$ of the full-scale value
Repeatability	$\leq \pm 1\%$ of the current measuring range
Drift	
Zero point	
• With AUTOCAL	Negligible
• Without AUTOCAL	$< 2\%$ of the current measuring range/week
Full-scale value drift	
• With AUTOCAL	Negligible
• Without AUTOCAL	$< 2\%$ of the current measuring range/week

Influencing variables

Temperature	Max. 2% of the smallest possible measuring range according to label per 10 K with an AUTOCAL cycle time of 6 h
Atmospheric pressure	$< 0.2\%$ of the current measuring range per 1% pressure change
Auxiliary power	$< 0.1\%$ of the current measuring range with a change of $\pm 10\%$

Technical data, oxygen channel

Measuring ranges	0 ... 5% to 0 ... 25% O ₂ , parameterizable
Service life	Approximately 2 years at 21% O ₂ ; continuous duty $< 0.5\%$ O ₂ will destroy the measuring cell

Dynamic response

Delayed display (T_{90} -time)	Dependent on dead time and parameterizable damping, not > 30 s at approximately 1.2 l/min sample gas flow
-----------------------------------	---

Measuring response

Output signal fluctuation	$< \pm 0.5\%$ of the current measuring range
Linearity error	$< \pm 0.2\%$ of the current measuring range
Repeatability	$\leq 0.05\%$ O ₂
Drift	
• With AUTOCAL	Negligible
• Without AUTOCAL	1% O ₂ /year in air, typical
Temperature	$< \pm 0.5\%$ O ₂ per 20 K, relating to a measured value at 20 °C
Atmospheric pressure	$< 0.2\%$ of the measured value per 1% pressure change

Influencing variables

Oxygen content	Intermittent operation $< 0.5\%$ O ₂ leads to falsification of the measured value
Carrier gases	The oxygen sensor must not be used if the residual gas contains the following components: H ₂ S, chlorine or fluorine compounds, heavy metals, aerosols, mercaptans, alkaline components (such as NH ₃ in % range)
Typical combustion exhaust gases	Influence: $< 0.05\%$ O ₂
Humidity	H ₂ O dew point ≥ 2 °C; the oxygen sensor must not be used with dry sample gases (however, no condensation either).

¹⁾ For measuring ranges below 1%, a CO₂ absorber cartridge can be used for setting the zero point (see accessories)

²⁾ Without separate zero gas input or solenoid valve

³⁾ User language can be changed

⁴⁾ Standard setting: smallest measuring range, largest measuring range

⁵⁾ O₂ sensor in gas path of infrared measured component 1

⁶⁾ With chopper compartment purging (N₂ approx. 300 kPa required for measuring ranges below 0.1% CO₂), to be ordered as a supplementary item (see Order code C02/C03)

⁷⁾ Not suitable for use with emission measurements since the cross-sensitivity is too high

⁸⁾ CO₂ measurement in residual gas Ar or Ar/He (3:1); forming gas

⁹⁾ Only in conjunction with Viton hose

¹⁰⁾ Only in conjunction with CO₂ measuring range 0 ... 5% to 0 ... 25% (CP)
