Hello

I have received a flyer about Viamed microstim DB3 supramaximal nerve stimulators.

We use these in my hospital.

I have an interest in muscle relaxation and monitoring.

These monitors are keenly priced.

However I think the future in neuromuscular monitoring is the use of objective monitors using techniques like accelerometry. Subjective monitors like the microstim are better than no monitor use, but are well documented as being inadequate at fully determining adequacy of reversal.

Do viamed produce or market any such devices, ie ?

If not any plans to do so?

If not might I be so bold as to encourage an interest in this area.

I am sure that developments in the next couple of years will push the use of such devices.

Regards  
Grant Rodney
