Optimal neonatal ventilation

<http://gradworks.umi.com/34/53/3453856.html>

2011

by Shelton, Julie A., D.N.P., THE COLLEGE OF ST. SCHOLASTICA, 2011, 72
pages; 3453856

The Neopuff Infant Resuscitator recently selected as a standard of care in the SMMC Neonatal Intensive Care Unit (NICU) and Birthplace, is a method of ventilating neonates that consistently delivers the same pre-set pressure with a consistent blend of oxygen and air; thus adequate ventilation/administration is not dependent on caregiver technique and experience.

University of Kentucky / UK HealthCare Policy and Procedure RC04-04P

Recommends usage of Neo Puff (T Piece resusitors)

Document ID#15734

Advantages of the Neopuff Resuscitator Operator sets PIP and PEEP pressures
Resuscitator will not deliver PIP or PEEP above set pressures PIP and PEEP
pressures are displayed on unit Operator controls the length of inspiratory time
Resuscitator delivers 100% free flow oxygen reliably

A comparison of three neonatal resuscitation devices. 2005

<http://www.ncbi.nlm.nih.gov/pubmed/16081202>

CONCLUSIONS:

The T-piece resuscitator delivered the desired pressures more accurately, but required greater time to increase the PIP from 20 to 40 cmH₂O. It was difficult to maintain a prolonged inflation and deliver the desired PEEP with the self-inflating bag even with the PEEP valve in place. There is a need for improvement in the design and function of current manual resuscitation devices and for prospective trials to evaluate the optimal method of bag and mask ventilation during resuscitation of the newborn infant.

Lessons in positive pressure ventilation
includes usage of T Piece resusitators

Manual of Neonatal Care

edited by John P. Cloherty, Eric C. Eichenwald, Anne R. Hanse

It offers greater control over manual ventilation by delivering breaths of reproducible size (peak and end-expiratory pressure) and a simplified method to control delivered breath rate.

Using a regulated means of admisniration, such as a T-piece resusciator or ventilator, is preferable.

Clinical question :

In newborns (P) requiring positive pressure during resuscitation, is positive pressure ventilation by T-piece resuscitator (I) superior to bag ventilation (C) for improving outcome - specify (O)?
27 JaN 2010,

CONSENSUS ON SCIENCE:

- There are no clinical studies in newborns requiring positive pressure during resuscitation to support or refute superiority of the T-piece resuscitator over bag ventilation in improving outcome.
- In mechanical models, target inflation pressures are delivered more consistently when using T-piece resuscitators than with self-inflating bags. (LOE 5 - Hussey 2004, F490; Oddie 2005, 109; Finer 2001, 299)
- In mechanical models, PEEP is maintained more consistently with T-piece resuscitators compared with self-inflating bags. (LOE 5 - Finer 2001, 299)
- In mechanical models, the ability to deliver a sustained inflation is better with either a T-piece resuscitator or flow-inflating bag compared with a self-inflating bag. (LOE 5 - Bennett 2005, 113)
