## Measurement Modes

The **AlcoTrue M** provides up to five measurement modes, ideal for any situation:

### ■ Active mode AM

To determine the precise alcohol level in the end-expiratory breath of the person to be tested after achieving a minimal breath volume from 1.2 L. It is ensured that only deep lung breath (alveolar breath) is analysed.

### ■ Fast mode FM

Intended for persons suffering from COPD, Asthma or reduced lung capacity, whom might not be able to provide the standard minimum sample volume.

### ■ Passive mode PM\*

To obtain a precise measurement, the sample uptake must be triggered when the person is breathing out. The measurement mode is to determine the quantitative value of alcohol concentration.

### ■ Scan mode SM\*

Qualitative testing of the ambient air alcohol content, qualitative determination of alcohol content in exhaled air of a person who is not able to provide a breath sample (e.g. unconscious person), qualitative test of "non-alcoholic" drinks for alcohol content.

### ■ Mouth alcohol mode MA\*

Consists of two tests with a determined waiting period between first and second measurement.

\* Measurement modes only available if activated.
